## Rejection area

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

(日) (同) (日) (日)

э

 $\chi^2$  test of goodness-of-fit (opt.)

Testing 
$$H_O$$
:  $p = p_0$  vs.  $H_A$ :  $p \neq p_0$ 

• Using z test:  

$$z_{c} = \frac{\hat{p} - p_{0}}{\sqrt{\frac{p_{0}(1 - p_{0})}{n}}}$$
reject  $H_{O}$  if  $|z_{c}| > z_{1 - \frac{\alpha}{2}}$ 

• Using 
$$\chi^2$$
 test:  
 $\chi^2 = \sum \frac{(O-E)^2}{E} = \frac{(O_1 - E_1)^2}{E_1} + \frac{(O_2 - E_2)^2}{E_2}$   
reject  $H_O$  if  $\chi^2 > \chi^2_{\alpha,df=1}$ 

- How well the distribution of sample data conforms to some theorical distribution\*
- d.f. = k r
- Small expected frequencies: there is disagreement among writers: 10, 5, 1 (*Cochran*).
  - Combining adjacent categories to achieve the suggested minimum.

• When combining  $\rightarrow \downarrow$  number of categories  $\rightarrow \downarrow d.f.$ 

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

- Most frequent use of  $\chi^2$  distribution
- A single population, where each member was classified according to 2 criteria: 1<sup>st</sup> criteria : row 2<sup>nd</sup> criteria : column
- Contingency table: r rows, c columns
- H<sub>O</sub>: 2 criteria of classification are independent
   H<sub>A</sub>: 2 criteria of classification are not independent

• df = 
$$(r - 1)(c - 1)$$

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

• • • • • • • • •

### • Small expected frequencies:

df > 2 & no more than 20% of expected frequencies < 5  $\rightarrow$ 1 df < 30  $\rightarrow$  2  $n > 40 \rightarrow 1$ 

•  $\chi^2$  test should not be used if:

n < 20, or  $20 \le n < 40$  & any  $E_i < 5$ 

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

(日) (同) (三) (三)

э

## $\chi^2$ test of independence

$$\chi^{2} = \sum \frac{(O-E)^{2}}{E} = \frac{(O_{1}-E_{1})^{2}}{E_{1}} + \frac{(O_{2}-E_{2})^{2}}{E_{2}} + \dots$$
  
reject  $H_{O}$  if  $\chi^{2}_{c} > \chi^{2}_{\alpha,df=(r-1)(c-1)}$ 

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

(日) (同) (三) (三)

э

## $\chi^2$ test of independence

For the 2 x 2 contingency table:  

$$\chi^{2} = \sum \frac{(O-E)^{2}}{E} = \frac{(O_{1}-E_{1})^{2}}{E_{1}} + \frac{(O_{2}-E_{2})^{2}}{E_{2}}$$

$$\chi^{2} = \frac{n(ad-bc)^{2}}{(a+b)(a+c)(b+d)(c+d)}$$
reject  $H_{O}$  if  $\chi^{2} > \chi^{2}_{\alpha,df=(r-1)(c-1)=1}$ 

$$\chi^{2} \text{ test of independence (opt.)} \qquad \overset{\text{Chi-square distribution & The analysis of frequencies}}{\overset{\text{Chi-square distribution & The analysis of frequencies}}$$

1

Yates' correction (also called continuity correction) - Pro and Cons  

$$\chi^{2}_{corrected} = \sum \frac{(|O-E|-.5)^{2}}{E} = \frac{(|O_{1}-E_{1}|-.5)^{2}}{E_{1}} + \frac{(|O_{2}-E_{2}|-.5)^{2}}{E_{2}}$$

$$\chi^{2}_{corrected} = \frac{n(|ad-bc|-.5n)^{2}}{(a+b)(a+c)(b+d)(c+d)}$$
reject  $H_{O}$  if  $\chi^{2}_{corrected} > \chi^{2}_{\alpha,df=(r-1)(c-1)=1}$ 

・ロン ・四マ ・ヨマ ・ヨマ

き うくぐ

Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary

Chi-square distribution & The analysis of frequencies Applications of the  $\chi^2$  Statistic

 $\chi^2$  test of homogeneity  $\chi^2$  test of independence with Fixed Marginal Totals

• To determine whether the distinct populations can be viewed as belonging to the same population (in terms of the criteria).

- $\chi^2$  test of independence: row and column totals are <u>not</u> under the control of the investigator  $\chi^2$  test of homogeneity: either row or column totals may be under the control of the investigator
- $\chi^2$  test of independence: ? independent (the 2 criteria)  $\chi^2$  test of homogeneity: ? homogeneous (the samples drawn from the same population
- $\chi^2$  test of homogeneity &  $\chi^2$  test of independence are mathematically equivalent but conceptually different.

イロト イポト イヨト イヨト

- $\chi^2$ test of Homogeneity for the 2-sample case provides an alternative method for testing the  $H_O$  that: 2 population proportions are equal.
- A method for comparing of 2 population proportions using z statistic with pool proportion(p̄):
   Let p̂<sub>1</sub> = x<sub>1</sub>/n<sub>1</sub>; p̂<sub>2</sub> = x<sub>2</sub>/n<sub>2</sub>; p̄ = x<sub>1+x<sub>2</sub>/n<sub>1+n<sub>2</sub></sub>
  </sub>

Test statistic: 
$$z_c = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)_0}{\sqrt{\frac{\hat{p}(1 - \hat{p})}{n_1} + \frac{\hat{p}(1 - \hat{p})}{n_2}}}$$

• Note:  $z_c = \frac{(\hat{p}_1 - \hat{p}_2) - (\rho_1 - \rho_2)_0}{\sqrt{\frac{\hat{p}_1(1 - \hat{p}_1)}{n_1} + \frac{\hat{p}_2(1 - \hat{p}_2)}{n_2}}}$  is just for discussion purposes

only. This equation should never be used as the test statistic for the difference between 2 proportions.

Calculating p value in Fisher's exact test The conventional vs. the mid p (opt.)

	Treatment	Control	Total	
0+	3	4	7	$P(x=3) = \frac{{}_{7}C_{3\cdot 6}C_{5}}{{}_{13}C_{8}}$
0-	5	1	6	= .1632
Total	8	5	13	1052
	Treatment	Control	Total	
O+	2	5	7	$P(x=2) = \frac{{}_{7}C_{2\cdot 6}C_{6}}{{}_{13}C_{8}}$
0-	6	0	6	=.0163
Total	8	5	13	

\*A useful check is that all the probabilities should sum to one (within the limits of rounding)

Nguyen Thi Tu Van, Nguyen Quang Vinh Learning Tests - Basic terms

Calculating p value in Fisher's exact test The conventional vs. the mid p (opt.)

## Probability distribution

Nguyen Thi Tu Van, Nguyen Quang Vinh

Calculating p value in Fisher's exact test The conventional vs. the mid p (opt.)

## Hypothesis

- $H_O: \pi_T = \pi_C$ (no difference between treatment & control group)
- $H_A: \pi_T > \pi_C$  (1-tailed), or
- $H_A: \pi_T \neq \pi_C$  (2-tailed)

Calculating p value in Fisher's exact test The conventional vs. the mid p (opt.)

## Calculate p value

- The observed set has a probability of 0.0816
- The p value is the probability of getting the observed set, or one more extreme.
- One tailed p value:
  - (1)  $p(x \ge 6) = p(x=6) + p(x=7) = 0.0816 + 0.0047 = 0.0863$ (this is the conventional approach).
  - (2) Armitage & Berry (1994) favor the mid p value: 0.5 x
     0.0816 + 0.0047 = 0.0455
- Two tailed p value:
  - (1)  $p(x \ge 6 \text{ or } x \le 2) = p(x=2) + p(x=6) + p(x=7) = 0.0816 + 0.0047 + 0.0163 = 0.1026$
  - (2) Double the one tailed result (approximation), thus:  $p=2 \times 0.0863 = 0.1726$  (for the conventional) or  $p=2 \times 0.0455 = 0.091$  (for the mid P approach)

Calculating p value in Fisher's exact test The conventional vs. the mid p (opt.)

## Outline

- Chi-square distribution & The analysis of frequencies
- Applications of the  $\chi^2$  Statistic
- 2 Fisher
  - Calculating p value in Fisher's exact test
  - The conventional vs. the mid p (opt.)
- 3 Student's t
- 🕘 Mann-Whitney U
- 5 Pearson and Spearman's correlation
  - Pearson and Spearman correlation
  - Cause and Effect
  - Correlation vs. Linear Regression

Chi-square Fisher Student's t Mann-Whitney U Pearson and Spearman's correlation Summary The conventional vs. the mid p (opt.)

- The conventional approach to calculating the p value for Fisher's exact test has been shown to be conservative (that is, it requires more evidence than is necessary to reject a false H<sub>O</sub>)
- The mid P is less conservative (that is more powerful) & also has some theoretical advantages

Chi-square Fisher Student's Mann-Whitney U Pearson and Spearman's correlation Summary Why is Fisher's test called an exact test? (opt.)

• Because of the discrete nature of the data, and the limited amount of it, combinations of results which give the same marginal totals can be listed, and probabilities attached to them.

 $\rightarrow$  thus, given these marginal totals we can work out exactly what is the probability of getting an observed result.

4 E N 4 E N 4 E N 4

## The t distribution

 $\Diamond$  PROBLEM:

•  $\sigma$  is known & not known  $\mu$  (!)

• Indeed, it is the usual case,  $\sigma \& \mu$  is unknown

 $\diamond$  We cannot make use the statistic:  $z = \frac{\bar{x} - \mu}{\frac{\sigma}{\sqrt{n}}}$  because  $\sigma$  is unknown, even when n is large,

 $\rightarrow$  use  $s = \sqrt{\frac{\Sigma(x_i - \overline{x})^2}{n-1}}$ to replace  $\sigma$ 

## The t distribution

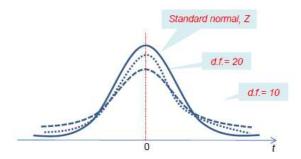

• William Sealy Gosset "Student" (1908)  $\rightarrow$  Student's t distribution = t distribution.

• The quantity: 
$$t = \frac{\bar{x} - \mu}{\sqrt{n}}$$
 follows this distribution.

э

## t distributions with degrees of freedom

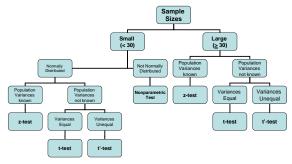

A requirement for valid use of the t distribution: ☆ sample must be drawn from a normal distribution. ☆ an assumption of, at least, a mound-shaped population distribution be tenable.

#### An interval estimate

- In general, an interval estimate is obtained by the formula: estimator ± (reliability coefficient) x (standard error)
- What is different is the source of the reliability coefficient:
  - In particular, when sampling is from a <u>normal</u> distribution with <u>known variance</u>, an interval estimate for  $\mu$  may be expressed as:  $\overline{x} \pm z_{\frac{\alpha}{2}} \sigma_{\overline{x}}$
  - when sampling is from a normal distribution with unknown variance, the  $100(1-\alpha)$ % confidence interval estimate for the population mean,  $\mu$ , is given by:  $\overline{x} \pm t_{\frac{\alpha}{2},n-1} \frac{s}{\sqrt{n}}$

#### z, t or t

#### Deciding between z, t, or t'

Flowchart for use in deciding whether the reliability factor should be use z, t, or t' when making inferences about the difference between two population means (\* use a nonparametric procedure)

э

# The Mann-Whitney Test

- When small samples from suspected nonnormal population substitution of 2-sample t test.
- Assumptions for M-W test:
  - 1. Independent, Random samples
  - 2. Data at least ordinal

3. If the 2 populations differ, they differ only in location (e.g., the 2 populations have the same variance and shape).

 Hypothesis: H<sub>O</sub>: 2 populations have identical of the probability distribution vs.

 $H_A$ : 2 populations differ in location (2-tailed), or

 $H_A$ : population 1 is shifted to the right of population 2 (1-tailed), or

 $H_A$ : population 2 is shifted to the right of population 1 (1-tailed)

Nguyen Thi Tu Van, Nguyen Quang Vinh Learning Tests - Basic terms

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

#### Correlation & Regression

- Nature & strength of the relationship between 2 variables: BP
   & age, cholesterol & age, size & weight of fetus...
  - $\rightarrow$  Correlation & Regression analysis

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

4 E N 4 E N 4 E N 4

### Correlation & Regression

• Correlation (1888): the strength of the associative relationship between 2 variables. *Correlation refers to the interdependence or co-relationship of* 

Correlation refers to the interdependence or co-relationship of variables.

 Regression (1899): the causal relationship between variables: predict, or estimate.
 Regression is a way of describing how one variable, the outcome, is numerically related to predictor variable(s).

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

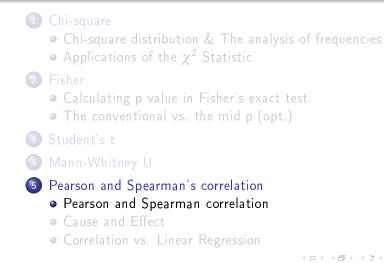

< D > < A < > < < >

Data types for correlation/regression analysis

- Need our data to be quantitative / numerical / continuous.
- If data can meaningfully be portrayed on a scatter plot.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

# Outline

Chi-square Fisher Student's t Mann-Whitney U Pearson and Spearman correlation Summary Pearson Correlation Coefficient

- Pearson's correlation coefficient is a measure of the closeness linear association between X and Y.
- ullet Denoted by r (sample statistic), and ho (population parameter).

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

Interpretation of r r is a much abused statistic

- r takes values between -1 and +1 inclusive: -1 < r < 1. Sign of + or -.
- Value r doesn't mean the steepness of the slope.
- The large |r| is, the stronger is the linear relationship.

+ Values of r close to -1 or +1 indicate a strong (negative or positive) linear relationship.

r is close to  $\pm$  1 then this does NOT mean that there is a good causal relationship between X and Y. It shows only that the sample data is close to a straight line.

+ Values of r close to zero indicate little linear relationship between 2 variables.

Even if r close to zero, there still may be a strong relationship in the form of a curve.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

(日) (同) (三) (

Interpretation of r (opt.) r is a much abused statistic

- Assumption of Pearson's correlation: at least one variable must follow a normal distribution.
- Confidence limits are constructed for r using Fisher's z-transformation.
- $r^2$  is closest to 1 when n = k + 1.
  - But n should be  $\geq 3(k + 1)$  for a more reliable regression model.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

Significance Test for Pearson's Correlation

 $H_O: \rho = 0$  (There is no linear relationship)  $H_A: \rho \neq 0$  (There is a linear relationship)

- The  $H_O: \rho = 0$  is evaluated using modified t-test.
- Conclusion significant linear correlation (i.e. ho 
  eq 0 ) if p-value < 0.05

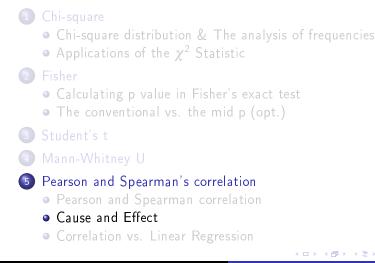

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

What if our data are only non-linearly related??

 Techniques are available for some non-linear relationships, e.g. Spearman's correlation coefficient can detect relationships which are (at least) monotonic.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

## Outline

Nguyen Thi Tu Van, Nguyen Quang Vinh Learning Tests - Basic terms

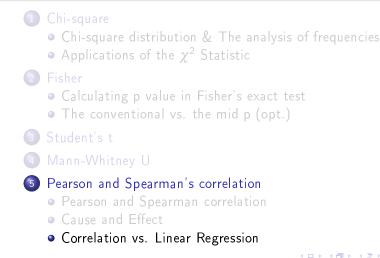

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

#### Cause and Effect

• Evidence of correlation does not (necessarily) mean that a cause and effect relationship exists.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

## Outline

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

#### Correlation vs. Linear Regression

- Only if substantive theory (*i.e. the science*) suggests a causal relationship between 2 variables do we have grounds to use linear regression analysis.
- Otherwise, correlation analysis is all we can use.
  - i.e. We are restricted to talking about associative relationships.
- Cross-sectional studies???
- Although mathematically similar, Regression analysis represents a much more rigorous formulation of the relationships between variables. It also introduces: a statistical model
  - Models are the mathematical representation (and simplification) of the system under study.

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

< < p>< < p>

#### The Use of Linear Regression

(If we believe that 2 variables do exhibit an underlying linear pattern)

- Data description, assessment:
  - Quantify the relationship between variables
- Parameter estimation
- Prediction and estimation:
  - Make prediction and validate the test
- Control: (in the case of multiple variables)
  - Adjusting for confounding effect

 $\frac{\begin{array}{c} \text{Chi-square} \\ \text{Fisher} \\ \text{Student's } \\ \text{Mann-Whitney U} \\ \text{Pearson and Spearman's correlation} \\ \text{Summary} \end{array}} \xrightarrow{\text{Pearson and Spearman correlation} \\ \text{Correlation vs. Linear Regression} \\ \text{What is a good value of } R^2$ 

It depends on the area of application:

- In the biological and social sciences, variables tend to be more weakly correlated and there is a lot of noise. R<sup>2</sup> is expected low in these areas - a value of 0.6 might be considered good.
- In physics and engineering, most data comes from closely controlled experiments, it is expected to get much higher R<sup>2</sup> and a value of 0.6 would be considered low.

 $\Rightarrow$  Experience with the particular area is necessary to judge  $R^2$ .

Pearson and Spearman correlation Cause and Effect Correlation vs. Linear Regression

- Can we arrange the equation:  $\hat{Y} = b_0 + b_1 X$  say,  $\hat{X} = -\frac{b_0}{b_1} + \frac{\hat{Y}}{b_1}$
- The answer is *no*, although the coefficient of correlation, *r*, is the same in either case.

## Summary

- Chi-square: the analysis of frequencies: goodness-of-fit, independence, homogeneity.
- Fisher's exact test: using when expected value in  $\chi^2$ test statistic is small.
- t test: a family of distributions, approaches the normal distribution as n-1 approaches infinity.
- Mann-Whitney test: when the assumptions for using the independent t test are violated.
- Correlation: associative relationship
  - Pearson correlation for linear relationships.
  - Spearman correlation for non-linear (at least) monotonic relationships.

A D > A A P >

• Regression: causal relationship.

- Why should not we use Chi-square distribution when expected value in  $\chi^2$ test statistic is small?
- What happen if we violate assumption(s) for using a test?
